Fresh water and Energy Production Hybrid System

The "Fresh Water and Energy Production Hybrid System" can provide fresh water and electricity to countries under development. It can easily be installed in arid areas where water is scarce.

Water Filter

Water is being pumped from the underground reservoirs and stored in the built-in tank. The filtering system purifies the water taken from the tank and delivers it to the distribution system. The system is completely autonomous, using solar and wind power to produce the electricity necessary for its operation. The Hybrid system is equipped with a high technology multimedia system that can be used for public information and entertainment.
